                                                                                                                                                                                                                                                                                                                                                                                                                 teeding;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       1599
```

This invention describes novel DNA sequences encoding for polyketide (PK)-like synthesis (PKS-like) pathway genes from Shewanella, Vibrio and Schizochtrium. The nucleic acids are useful for isolating related molecules or in methods to detect organisms expressing the PKS-like genes. They are also useful for creating transgenic plants that exprespoly-unsaturated long chain fatty acids. The poly-unsaturated long chain

patients undergoing intravenous feeding or for preventing or treating malnutrition. The poly-unsaturated long chain fatty acids can also be incorporated into cooking oils, fats or margarine formulated so that in normal use the recipient receives a desired amount of poly-unsaturated long chain fatty acids. The nucleic acids are also useful in large scale production of docosahaxenoic acid and elcosapentenoic acid, and for the modification of the fatty acid profile of host cells and edible plant tissues and/or plant parts. Transgenic production of polyunaaturated fatty acids in particular host cells allows quicker purification from antural sources auch as fish or plants. This sequence represents the Shewanella putrefaciened bNA sequence encoding the PKS gene cluster ORF4 which is described in the method of the invention.
acids produced recombinantly are useful as dietary supplements for

AAZ53015 to AAZ54536, AAZ54577 to AAZ54615, and AAY74253 to AAY5941 and polypeptides AAZ54576 and AAZ54616 to AAZ5473 represent properties AAZ5477 to AAZ5456 and AAZ54616 to AAZ5473 represent PCR primers used in the exemplification of the present invention. The polypeptides, the polynucleotides, antibodies and compositions of the invention can be used as vaccines, as diagnostic reagents, and as immunogenic compositions. The polypeptides can be used in the manufacture of medicaments for treating or preventing infection due to Neisserial bacteria (e.g. meningitis and septicaemia), to detect the presence of Neisseria bacteria, or to raise antibodies. They may also be used to screen for agonists or antagonists, which may themselves may also be used in gene therapy protocols.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          δ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              AAA81476
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 RESULT 27
CC The present invention describes methods of obtaining immunogenic CC proteins from Neisseria genomic sequences. AAA81453 to AAA82414 CC represent specifically claimed Neisseria meningitidis genomic DNA CC sequences; AAA81260 to AAA81303 and AAB55620 to AAB25663 represent CC AAA81259 and AAA81304 to AAA81301 represent PCR primers used in the CC AAA81259 and AAA81304 to AAA81321 represent PCR primers used in the CC AAA81259 and AAA81304 to AAA81321 represent PCR primers used in the Sequences, which are all used in the exemplification of the present CC sequences, which are all used in the exemplification of the present CC invention. The nucleic acid sequences, protein sequences, and antibodies against them, can be used in the manufacture of a composition. The CC composition can be used as a medicament (or in the manufacture of a medicament) for treating, preventing or diagnosing infection due to Neisserial bacteria. For example, some of the identified proteins could be components of vaccines against Meningococcus B; against all serotypes; and or against all pathogenic Neissariae. Identification of sequences composition and the probes of the bacterium will also facilitate production of biological probes, particularly organism-specific probes. Attempts to make efficacious CC Meningococcus B vaccines have failed mainly due to antigen tolerance.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Frazer CM, H.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 1171
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         1123

Multivalent vaccines have also been tried but none have successfully overcome antigenic variability. The provision of further, complete sequences may provide an opportunity to identify secreted or surface exposed proteins that may be presumed targets for the immune system a which are not antigenically variable or at least more conserved than other more variable regions.

AAF21545 to AAF21588 encode the Neisseria proteins given in AAB58550 to AAB58593, and AAF21589 to AAF21606 represent PCR primers which are used in the exemplification of the present invention. The NMB genome and fragments from it have antibacterial activity, and can be used in vaccines and gene therapy. Neisseria nucleic acids, proteins and/or antibodies which binds to the proteins can be used in compositions for treating or preventing infection the to Neisserial harterial are as discretify repeated.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Neisseria meningitidis B full length genome sequence and open reading frames are used to detect, treat and prevent Neisserial infections - \frac{1}{2}
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Sequence 349980 BP; 86473 A;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        bacteria. Computers, computer memory, computer storage medium or computer databases can be used in a search to identify open reading frames (ORFs) or coding sequences within the NMB genome. The DNA sequences provide further opportunities to find antigenic or immunogenic proteins which are more effective in vaccines than the outer membrane proteins currently
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present invention describes the full length genome of Neisseria meningitidis B (NMB). The sequences in AAP21544 and AAF21607
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Claim 7; Appendix A; 692pp; English.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                due to Neisserial bacteria or as a diagnostic reagent for detecting the presence of Neisserial bacteria or of antibodies raised to Neisserial
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Мо.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present invention describes methods of obtaining immunogenic proteins from Neisseria genomic sequences. AAA81453 to AAA82414

C represent specifically claimed Neisseria meningitidis genomic DNA sequences; AAA81260 to AAA81303 and AAB25620 to AAB2565 represent PC AAA81259 and AAA81304 to AAA81312 represent PCR primers used in the ciscletion of Neisseria meningitidis DNA sequences; and AAA8132 to AAA81452 and AAA8132 to AAA8132 represent Neisseria meningitidis DNA sequences; and AAA8132 to AAA81452 represent Neisseria meningitidis DNA sequences, and AAA8132 to AAA81452 represent Neisseria meningitidis DNA sequences, and AAA8132 to AAA81452 represent Neisseria meningitidis Mens polymucleotide ORF composition can be used in the manufacture of a composition can be used in the manufacture of a composition can be used in the manufacture of a composition can be used in the manufacture of a composition can be used as medicament (or in the manufacture of a medicament) for treating preventing or diagnosing infection due to Neisserial bacteria. For example, some of the identification of sequences and/or against all pathogenic Neissariae. Identification of sequences from the bacterium will also facilitate production of biological probes, and/or against all pathogenic probes. Attempte to matigen tolerance. Multivalent vaccines have also been tried but none have successfully overcome antigenic variability. The provision of further, complete sequences may provide an opportunity to identify secreted or surface exposed proteins that may be presumed targets for the immune system and contains had a matigenically variable or at least more conserved than and partically variable or at least more conserved than
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Scarlato V;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      490512
  Sequence 2078
                                             The present sequence encodes a Neisseria meningitidis BASB053 polypeptide. The BASB053 polypeptide, or an antibody immunospecific for BASB053 may be identified in a biological sample in order to diagnose a Neisseria meningitidis infection in an animal. The BASB05: polypeptides and polynucleotides may be used as vaccines, for generating an immune response in an animal. A composition comprising at least one antibody immunospecific for BASB053 may be used to treat humans infected with Neisseria meningitidis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                            WPI; 2000-476062/41

The invention relates to isolated polynucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerse chain reaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polynucleotides are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques to restore normal activity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitetaing a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful for treating imaging of sites expressing (II). (I) and (II) are useful for treating disorders involving aberrant protein expression or biological activity. The polypeptide and polynucleocitde sequences have applications in diagnostics, forensics, gene mapping, identification of mutations
                                                                                                                                                                                                                                                       1020 AGCTACAGCAGGCCTTTCCGCTTGGCCAATACGGCCAACGAATTTGTCATCGGCGCCCGAT 1079

                                                                                                                                                          from known cytopathic viruses, by appearance progression and/or host range, or by serological, electron microscopic and/or molecular markers. The products can be used for detecting viruses in patients with diseases such as a malignancy, e.g. multiple mycloma, lymphoma, brain tumours, breast cancer, salivary gland tumours, Alzheimer's disease, parkinson's disease, spongiform encephalopathy, multiple sclerosis, schizophrenia, manic depression, major depression, personality disorders, autism, Rett's syndrome, attention deficit, oppositional defiance, aggression, anorexia nervosa, bulimia, a multi-system lilness, an animal illness or an illness in a domestic dog or cat. The products can be used for detecting Stealth viruses in biological products such as blood products and foods. The products can also be used for treating or preventing virus infections.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               invention. The specification describes tissue culture, serological molecular based methods to detect atypically structured viruses, such as Stealth viruses, which are able to induce a vacuolating cytopathic effect (CPE) in time culture, and are distinguishable corresponding to the contraction of the contraction of the contraction of the contraction of the contraction of the contraction of the contraction of the contraction of the contraction of the contraction of the contraction of the contraction of the contraction of the contraction of the contraction of the contraction of the contraction of the contraction of the contraction of the contraction of the contraction of the contraction of the contraction of the contraction of the contraction of the contraction of the contraction of the contraction of the contraction of the contraction of the contraction of the contraction of the contraction of the contraction of the contraction of the contraction of the contraction of the contraction of the contraction of the contraction of the contraction of the contraction of the contraction of the contraction of the contraction of the contraction of the contraction of the contraction of the contraction of the contraction of the contraction of the contraction of the contraction of the contraction of the contraction of the contraction of the contraction of the contraction of the contraction of the contraction of the contraction of the contraction of the contraction of the contraction of the contraction of the contraction of the contraction of the contraction of the contraction of the contraction of the contraction of the contraction of the contraction of the contraction of the contraction of the contraction of the contraction of the contraction of the contraction of the contraction of the contraction of the contraction of the contraction of the contraction of the contraction of the contraction of the contraction of the contraction of the contraction of the contraction of the contraction of the contraction of the contraction of t
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Disclosure;

```
This sequence represents a Stealth virus nucleic acid clone. The invention relates to a method of detecting and characterising a stealth virus by reacting a sample suspected of containing a stealth virus with a probe from a known stealth virus and sequencing the resultant isolated nucleotide. The method comprises the steps of: (a) isolating DNA or RNA from a sample suspected of containing a stealth virus, e.g. a culture of cells showing a viral cytopathic effect; (b) testing the reactivity of the isolated DNA or RNA with a molecular probe that contains at least 18 or more contiguous nucleotides identical to sequence previously cidentified from a stealth virus; and, optionally (c) sequencing the isolated DNA or RNA molecules that react with the probe. The method is used to detect stealth virus in a biological product, food or in the solated DNA or RNA molecules that react with the probe. The method is used to evaluate agents for their inhibitory or stimulatory effects on stealth virus replication and to determine capacity of the virus to recombine with and potentially alter the nucleic acid sequences of a cell or bacterium.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            1164 GTGGCGGTGCGTTGGATGCTATCGCACAGACA---AACTTAAATGCACAGGATGGC--- 1711

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                10112
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to a method of identifying compounds that modulate a newly identified mar regulated (NIMR) polypeptide activity. The method comprises contacting an NIMR polypeptide with a test compound under interaction conditions, determining the ability of the compound to modulate the activity or expression of the polypeptide, and selecting the modulators. NIMR nucleic acids and polypeptides are used in the treatment of microbial infections, and in screening for modulators of NIMR expression and activity. These modulators can be used to reduce the infectivity of a microbe on a surface, and the virulence of a microbe in a subject suffering from an infection. AAS46232-AAS46278 represent Escherichia coli NIMR coding sequences of the invention.

The invention relates to a novel DNA array giving a representation of a number of Methylococcus capsulatus genes. The method of the invention is useful for determination of the differential expression of the genes of M. capsulatus, and for studying gene expression on a genomic scale and in gene expression assays of M. capsulatus genes. The sequences shown in ABQ90016-ABQ91855 represent M. capsulatus genes for use in arrays of the

          This sequence represents the Moraxella catarrhalis strain 4223 tbpA-ORF3-tbpB locus, and encodes the LESI transferrin binding protein (Tbp2-ORF3 the invention. This sequence is also referred to as the TbpB gene. The TbpB gene is used to produce recombinant Tbp2; for identification or diagnosis of Moraxella, or for cloning related

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Adherence conferring plasmid pear (AAT10105) comprises Escherichia coli 0157:H7 chromosomal DNA plus the Stratagene SK+ vector. It includes 3 open reading frames, 2 of which are homologues of terE and terD genes necessary for tellurite resistance. The third ORF is homologous to the IrgA gene and encodes an adhesin (AAR75366) that enables E. coli 0157:H7, an antibiotic-resistant, virulent and common food-borne pathogen, to adhere to epithalial cells. This ORF can be utilised in the prodn. of adhesin for use as a vaccine to prevent disease or colonisation of mucosal surfaces by 0157:H7.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         epithelial adhesin - a vaccine to prevent

The invention relates to a library of DNA fragments of Bscherichia coli strains comprising polymucleotides (ABA8877-ABA88729 and ABA89533) and encoded proteins (ABB52459-ABB52919 and ABB52394-ABB53094) of nature B2/D+A. The polymucleotides have potential antiinflammatory, antibacterial and immunosuppressive activity as part of pharmaceutical antibacterial and immunosuppressive activity as part of pharmaceutical
  Sequence
                                      septicaemia, pyelonephritis and meningitis this is particularly advantageous as bacterial resistance is increasing with the mor frequent use of broad spectrum antibiotics.
                                                                                                compositions used to treat, palliate or prevent extra-intestinal B. coli infections. The polypeptides are useful for determining the phylogenic group of a given B. coli strain. These polypeptides can detect and treat an undesired development of E. coli, particularly an extra-intestinal infections that include systemic and non-diarrhoeal infections such as
                                                                                                                                                                                                                                                                                                                                                                                               A library of DNA fragments of Escherichia coli strains for phylogenic determination of a given strain comprises polynous

strains comprising polynucleotides (ABA88577-ABA88729 and ABA89533)
and encoded proteins (ABB2459-ABB5219) and ABB22954-ABB53094) of nature B2/D+A-. The polynucleotides have potential antifilammatory, antibacterial and immunosuppressive activity as part of pharmaceutical compositions used to treat, palliate or prevent extra-intestinal E. coli fifections. The polypeptides are useful for determining the phylogenic group of a given E. coli strain. These polypeptides can detect and treat an undesired development of E. coli, particularly an extra-intestinal infection that include systemic and non-diarrhoeal infections such as septicamia, pyelonephritis and meningitis this is particularly as advantageous as bacterial resistance is increasing with the more frequent use of broad spectrum antibiotics. invention relates to a library of DNA fragments of Escherichia coli ||| ::: ||| || || || || || ACCTCCACGGCAGGTGGTCAATACG 5346 GITAGCGATCAGGTTCTGGAAAACCAGAATGCGACACGCTGGATGAGGCGCTTTATAAC 5406 GGG-----TTTGGCGCAAACCGGGATGGCTCCATCATGACCAACGGTCTGCGAACCGTA 5520 CTTCCTCGTAGTTTCAACGCCGCAACAGAGCGTGTGGAAGTGCTAAAAAGGCCCGGCCTCC 5580 5634 ||||||| ::: |TGGCG-------TATCGCCTTACCGGGAAGTGCAGATGAGATTACTGG 5778 5209 AAAGATGGCGAAACAATCACTGTTACAGCAGAT------GCAAATACC 5250 5635 CCGGAAAAAACATTC--------CATGCTTCGGTTTCAGCCACCTCCTCC 5676 ---SerAsnPheGlyGln-----ThrMetHisGlyArgGlnValGlnPheLeuLeuAsn 114 132 AsnProAsnGln------ValAlaArgIleGluValLeuSerGly---AlaThr 146 SerileTyrGlySerGlyAlaThrGlyGlyLeuileAsnileValThrLysSerAspLeu 166 GluGluGluGlnPheGluThrArglleGlyValHisGlySer -- LysLeuSerSerGlu 185 GlyValProLeuThrGlySerArgAgp-----IleSerArgGlnLeuAsnSerIle 131 54 IleThrGlnMetProHisThrThrLysVallleTyrGluGluGlnGlnGluGlnAla 73 GlyIleGlyTyrGlnValGlyGln---SerValAlaGlyValSerGluAenGlyAenVal ---AsnGluSerLeuProThr 34 ValGluLeuGluProValValIleThrIleAspLysSerGlyMetAlaLeuAlaAsnArg 5251 GCAACTGAGGCA---------ACCGATGGTTATCAACCTCTGAGC LeuAlaArgLeuAspValAspTyrArgThrThrGlyGlyAlaPheAspAlaAsn----ThrGlySerArgGlnLeuAlaAspValMetAlaGlnLeuIleProSer------Sequence 7315 BP; 2094 A; 1928 C; 1657 G; 1636 T; 0 other; 7315 87 45 132 95 22 Length: Matches: Conservative: Mismatches: Indels: 18 AlaValThrGlnGlnLeuTyrAlaGlnPro--x ABA88834 (1-7315) 0.018 135.50 36.77% 24.23% 6.62% US-09-889-746-2 (1-400) Similarity: Percent Similarity: Alignment Scores: Query Match: .. 02 Best Local 5149 5347 5407 115 5521 147 5734 5287 98 167 186 205 90 5467 8×366666666688×8 g 8 유 g ò g 요 g ò ద ò 엄 ò ઠે a ò ò g ò 8 ઠે à ò

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Ś
polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polymucleotides are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques to restore normal activity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            5779
                                                                                                                                                                                                                                                                                                                                                                                                                                                           New isolated polynucleotide and encoded polypeptides, useful diagnostics, forensics, gene mapping, identification of mutal responsible for genetic disorders or other traits and to assume the disorders of the traits and to assume the disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     31-MAR-2000; 2000US-0540217.

(I) and (II) are useful for treating disorders involving aberrant protein expression or biological activity. The polypeptide and polynucleotide sequences have applications in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and amino acid sequences. AAS64197-AAS94564 prosesent novel human diagnostic coding sequences of the invention.

Note: The sequence data for this patent did not appear in the printed specification, but was obtained in electronic format directly from WIPO

                                                                                                                                                                                                                                                                                                                                                                                                                                  .
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to isolated polynuclectide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polynuclectides are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques to restore normal activity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful for treating disorders involving aberrant protein expression or biological activity. The polypeptide and polynuclectide sequences have applications in diagnostics, forensites, gene mapping, identification of mutations responsible for genetic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and and assent and an anino acid sequences.                                                                                                             Percent Similarity:
                                                                                                                                                  Alignment
                                                                                                                                                                                                                                                                                                                                                    The invention relates to antisense inhibitors of genes essential to prokaryotic cellular proliferation, their use in identifying the genes, their use in the discovery of novel antibictics, the essential genes themselves and the encoded proteins. The prokaryotes used are Escherichia coli, Staphylococcus aureus, Salmonella typhi, Klebsiella pneumoniae, Pseudomonas aeruginosa and Enterococcus faecalis. The invention is also useful for the identification of potential new targets for antibiotic development. The antisense mucleic acids can also be used to identify protein also be used
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     AAS51469;

                                                                                                                                                                                                                                         to identify proteins used in proliferation, to express these proteins, and to obtain antibodies capable of binding to the expressed proteins. The proteins can be used to screen compounds in rational drug discovery programmes. The antisense nucleic acid sequence is also useful to screen for homologous nucleic acids which are required for cell proliferation in a wide variety of organisms. The present sequence encodes an essential prokaryotic cellular proliferation protein.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present sequence encodes the Moraxella catarrhalis 4223 transferrin binding protein tbpA, which can be used as an immunogen, e.g. in vaccines to protect against diseases caused by M. catarrhalis (specifically otitis media), or to raise antibodies for diagnosis and therapy. It can also be used as a carrier for other antigenic determinants, e.g. of bacteria corntaining polysaccharide antigens or abnormal polyaeccharides present on tumour cells, particularly to make conjugate vaccines. The tbpA DNA can be used to detect nucleic acid encoding transferrin receptor protein, e.g. for diagnosis or gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        DNA encoding transferrin receptor of a Moraxella strain - proteins, useful in vaccines, as diagnostic agents and in production of antibodies
                                                                                                             catarrhalis 4223 transferrin binding protein tbpA gene.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 -0229343
```

```
The invention relates to novel isolated polypeptides (I), and colymucleotides (II). (II) and the antibody to (I) are useful for diagnosing, preventing and treating diseases including immune system disorders (e.g. congenital and acquired immunodeficiencies, autoimmune clisorders (e.g. congenital and acquired immunodeficiencies, autoimmune trajections and graft versus host disease, infectious diseases (e.g. heparitis C), bleeding disorders, haemoglobin abnormalities and other blood-related disorders (sickle cell anaemia), myeloproliferative disorders, primary haematopoietic disorders, hyperproliferative disorders (e.g. daucher's disease, Parkinson's disease), chromosomal abnormalities (Down syndrome), ischaemic injury (e.g. stroke), renal chorders (e.g. glomerulomephritis), cardiovascular disorders (e.g. arrhythmia), respiratory disorders, dermatological disorders (inflammatory disorders), liver disorders (inflammatory disorders), liver disorders (cirrhosis), as stimulators of B-cell responsiveness to pathogens, activators of the induce tumour proliferation in pathologies e.g. acquired immune deficiency syndrome (AISO) -AAS26976-AAS27850 represent novel signal transduction cycle pathway protein coding sequences and PCR primers of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Novel polypeptides useful for diagnosing, treating, preventing and/or prognosing disorders related to the proteins, including cancers, immune disorders and neuronal disorders
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Claim 1; SEQ ID No 510; 880pp; English

The invention describes an isolated nucleic acid molecule (I) encoding a convertion between the protein. (I) and polypeptides (III) encoded by (I), are used to treat a medical conditions and in diagnosis of a pathological condition. Disorders which are diagnosed or treated include autoimmune diseases e.g. rheumatoid arthritis, hyperproliferative disorders e.g. cardiac arrest, cerebrovascular disorders e.g. cerebral isohaemia, andiogenesis, nervous system disorders e.g. Alzheimer's disease and amplication, gastrointestinal disorders e.g. dysphagia, candiac arrest, cardiac arrest, cerebrosis, infections caused by bacteria, viruses e.g. Acquired immunodeficiency virus (AIDS) and fungi, ocular disorders e.g. deported in munodeficiency virus (AIDS) and fungi, ocular disorders e.g. desorders e.g. disorders e.g. desticular feminisation, endocrine disorders e.g. diabetes and pituitary dwarfism, cancers and disorders at the cellular level e.g. leukaemia, disorders e.g. nonallergic rhinitis, renal disorders e.g. capter disorders e.g. nonallergic rhinitis, renal disorders e.g. nonallergic rhinitis, renal disorders e.g. nofiteration. The polypeptides can also be used to aid wound healing and captehalial cell proliferation, to prevent skin aging due to sunburn, to maintain organs before transplantation, for supporting cell culture of primary tissues, to resperate tissues and in chemotraxis. The copylapptides can also be used as a food additive or preservative to increase or decrease storage capabilities, fat content, libid, protein,
